

Frontend Developer coding assignment

Create a simple React app with following routes/pages:

- `/` Shows all the posts from the API listed chronologically with the ability to click on them and open their details. Each post shown on this page should contain a title, post date, creator user, post tags and the brief showcase of it's content.
- `/:id/` Shows the post with the designated id and it's contents. It should contain same data as the showcase on homepage has, but with the content fully visible and it's corresponding comments. There should also be a box to create a new comment that doesn't have to have actual API connection.
- `/:id/edit/` Shows a form to edit post with the designated id parameter. Actual API functionality is optional.
- `/create/` Shows a form to create and publish a new post. Actual API functionality is optional.

Bonus points:

- Using Redux for state management;
- Using TypeScript;
- Making the app aesthetically pleasing and mobile-friendly;
- Clean and well-organized code;
- Any additional functionality that you think could be added;

For the actual API, we are going to use [DummyAPI](#).

If you have any questions regarding the task office@normasoft.net.
